

Age and BMI (used jitter to show distribution)

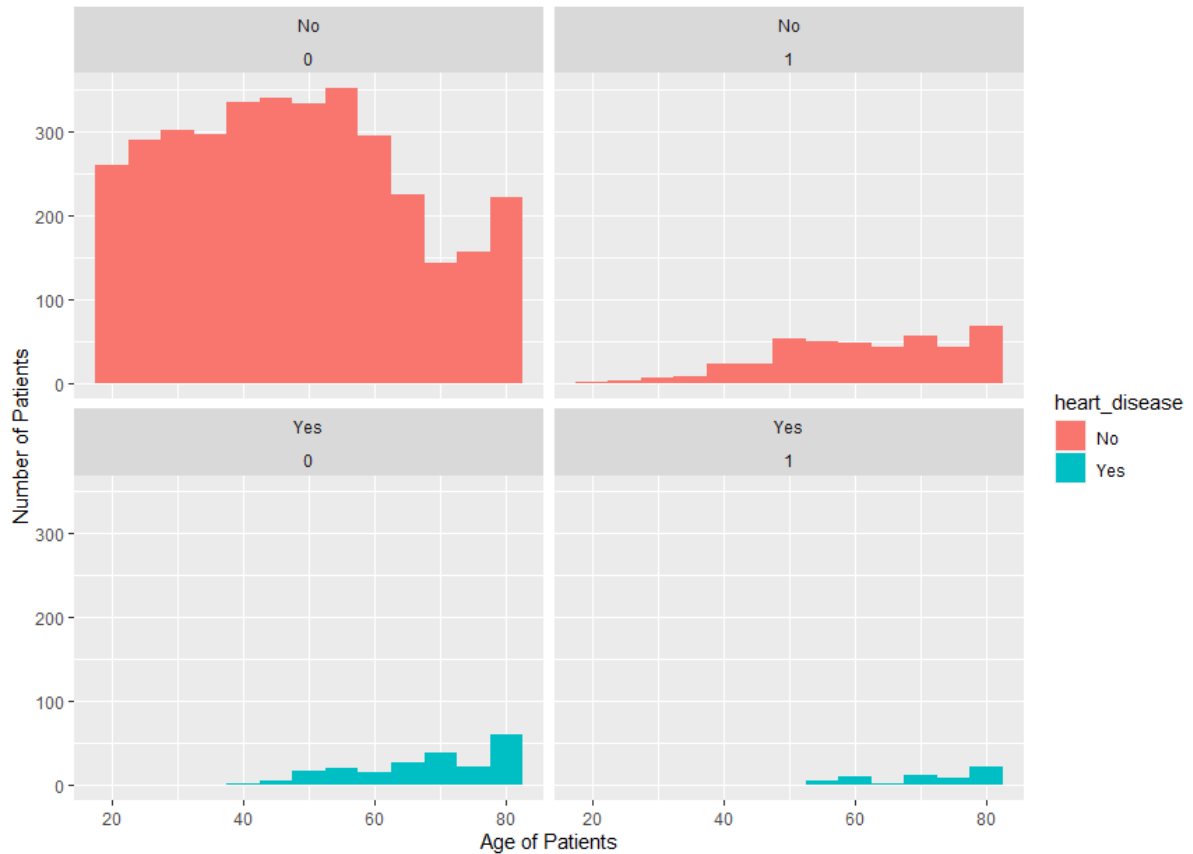

Average Glucose Level INCREASES with Age

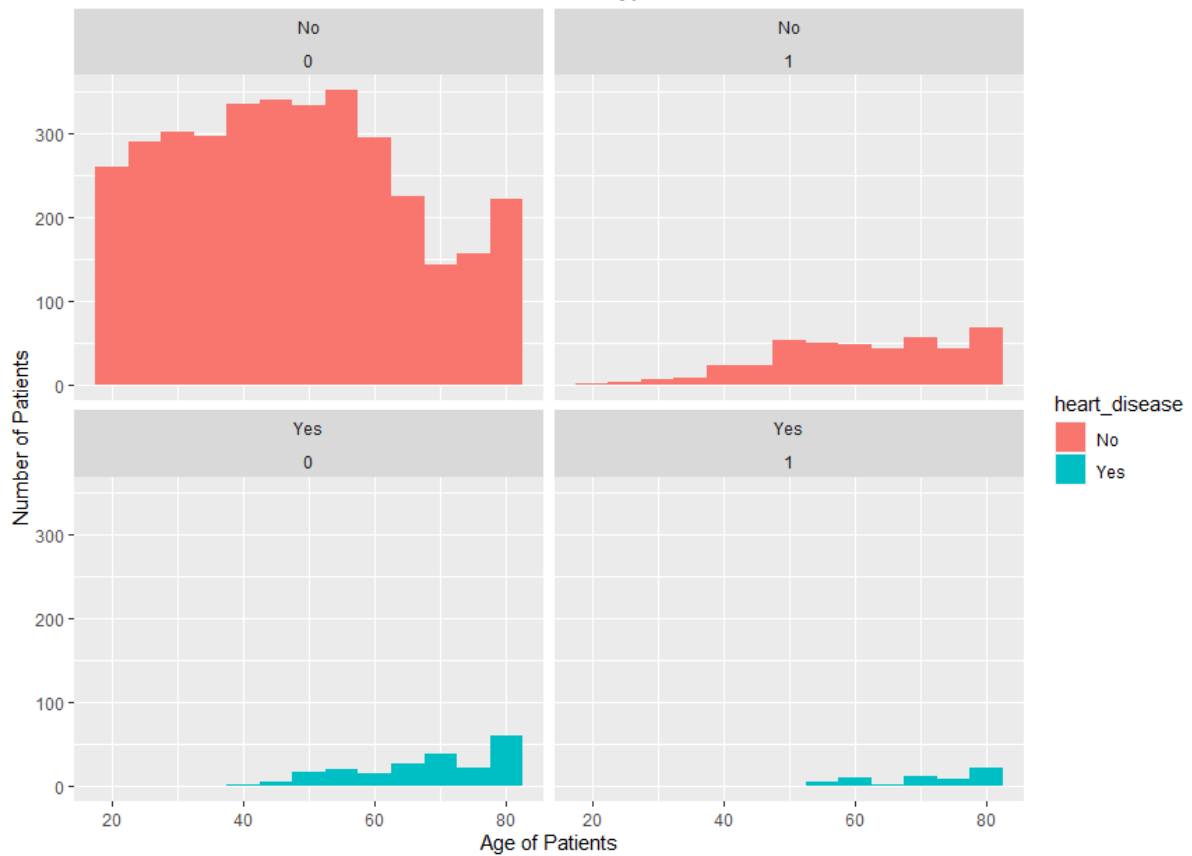

Former Smokers with Heart Disease (n=77) vs Current Smokers with Heart Disease (n=61)

There are 47 Patients with Heart Disease AND Stroke

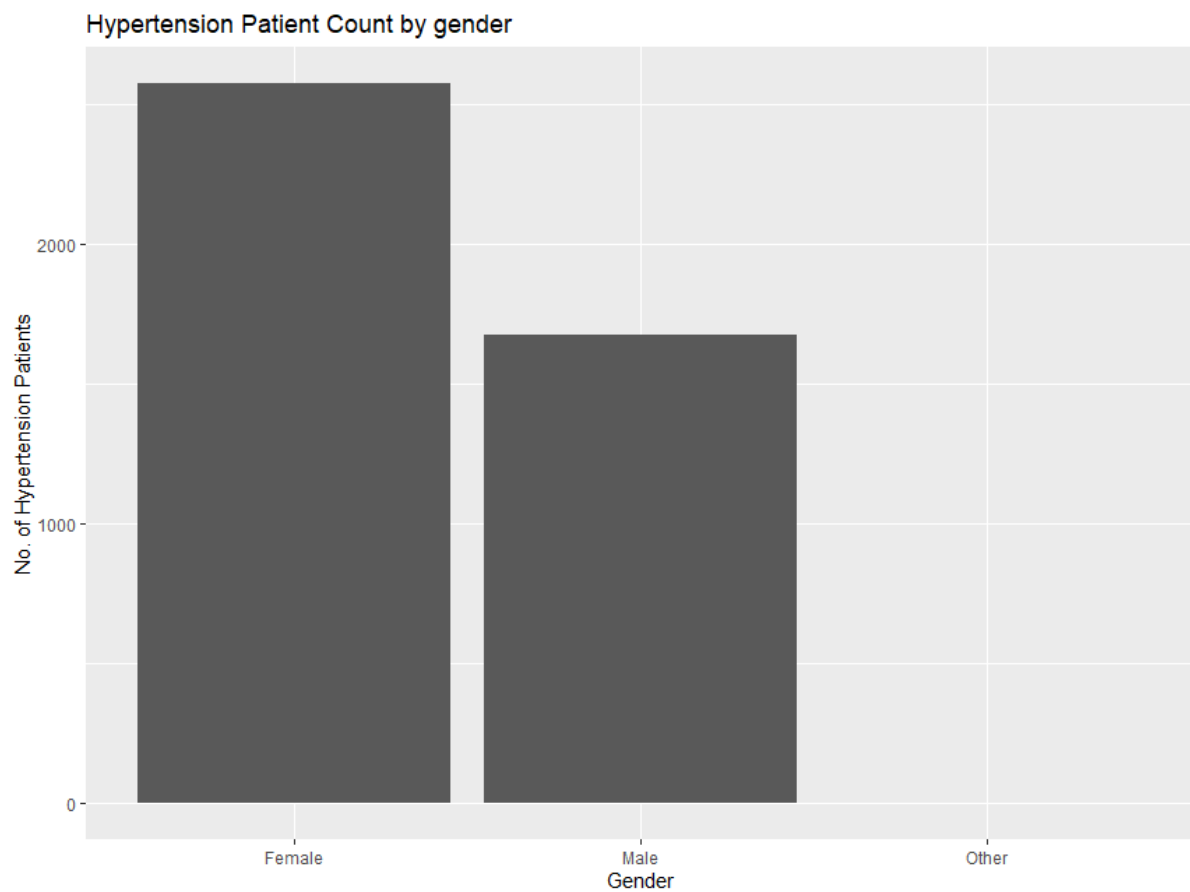

There are 64 Patients with Heart Disease AND Hypertension

More elderly patients (age >65) have heart disease than younger patients

(Data for this graph is not proper and a lot of inconsistency in the dataset regarding the 'Other' Gender category was noticed – how can we fix : Data Normalization in R)
